## Potash Production Process

3DLevelScanner

### Granular Potash

**Application:** Granular potash, the finished product, is transferred to onsite warehouses and large silos. Different grades of potash are stored separately.

**Challenges:** The granular potash is stored in large domes that can reach 150 feet in diameter, making accurate volume measurement of the dome's contents very difficult. This impacts the end-user's inventory management and control capabilities. BinMaster's MVL system provides accurate real-time volume measurement with 3D visualization of the distribution of the material stored inside the dome, solving these issues.
