Safety instructions for Ex areas

Take note of the Ex specific safety instructions for Ex applications. These instructions are attached as documents to each instrument with Ex approval and are part of the operating instructions manual.
1  About this document

1.1  Function
This operating instructions manual provides all the information you need for mounting, connection and setup as well as important instructions for maintenance and fault rectification. Please read this information before putting the instrument into operation and keep this manual accessible in the immediate vicinity of the device.

1.2  Target group
This operating instructions manual is directed to trained specialist personnel. The contents of this manual should be made available to these personnel and put into practice by them.

1.3  Symbols used

- Information, tip, note
  This symbol indicates helpful additional information.

- Caution: If this warning is ignored, faults or malfunctions can result.

- Warning: If this warning is ignored, injury to persons and/or serious damage to the instrument can result.

- Danger: If this warning is ignored, serious injury to persons and/or destruction of the instrument can result.

- Ex applications
  This symbol indicates special instructions for Ex applications.
  
  - List
    The dot set in front indicates a list with no implied sequence.

  - Action
    This arrow indicates a single action.

1  Sequence of actions
Numbers set in front indicate successive steps in a procedure.

- Battery disposal
  This symbol indicates special information about the disposal of batteries and accumulators.
2 For your safety

2.1 Authorized personnel
All operations described in this operating instructions manual must be carried out only by trained specialist personnel authorized by the plant operator.

During work on and with the device the required personal protective equipment must always be worn.

2.2 Appropriate use
Operational reliability is ensured only if the instrument is properly used according to the specifications in the operating instructions manual as well as possible supplementary instructions.

2.3 Warning about incorrect use
Inappropriate or incorrect use of the instrument can give rise to application-specific hazards, e.g. vessel overfill or damage to system components through incorrect mounting or adjustment. Also the protective characteristics of the instrument can be influenced.

2.4 General safety instructions
This is a state-of-the-art instrument complying with all prevailing regulations and guidelines. The instrument must only be operated in a technically flawless and reliable condition. The operator is responsible for the trouble-free operation of the instrument.

During the entire duration of use, the user is obliged to determine the compliance of the necessary occupational safety measures with the current valid rules and regulations and also take note of new regulations.

The safety instructions in this operating instructions manual, the national installation standards as well as the valid safety regulations and accident prevention rules must be observed by the user.

For safety and warranty reasons, any invasive work on the device beyond that described in the operating instructions manual may be carried out only by personnel authorised by the manufacturer. Arbitrary conversions or modifications are explicitly forbidden.

The safety approval markings and safety tips on the device must also be observed.

Depending on the instrument version, the emitting frequencies are in the C, K or W band range. The low emitting frequencies are far below the internationally approved limit values. When used correctly, the device poses no danger to health.
2.5 CE conformity

The device fulfils the legal requirements of the applicable EC guidelines. By affixing the CE marking, we confirm successful testing of the product.

Electromagnetic compatibility

Instruments in four-wire or Ex-d-ia version are designed for use in an industrial environment. Nevertheless, electromagnetic interference from electrical conductors and radiated emissions must be taken into account, as is usual with class A instruments according to EN 61326-1. If the instrument is used in a different environment, the electromagnetic compatibility to other instruments must be ensured by suitable measures.

2.6 NAMUR recommendations

NAMUR is the automation technology user association in the process industry in Germany. The published NAMUR recommendations are accepted as the standard in field instrumentation.

The device fulfils the requirements of the following NAMUR recommendations:

- NE 21 – Electromagnetic compatibility of equipment
- NE 43 – Signal level for malfunction information from measuring transducers
- NE 53 – Compatibility of field devices and display/adjustment components
- NE 107 – Self-monitoring and diagnosis of field devices

For further information see www.namur.de.

2.7 Environmental instructions

Protection of the environment is one of our most important duties. That is why we have introduced an environment management system with the goal of continuously improving company environmental protection. The environment management system is certified according to DIN EN ISO 14001.

Please help us fulfil this obligation by observing the environmental instructions in this manual:

- Chapter "Packaging, transport and storage"
- Chapter "Disposal"
3 Product description

3.1 Configuration

The type label contains the most important data for identification and use of the instrument:

![Type label layout](image)

Fig. 1: Layout of the type label

1. Instrument type
2. Product code
3. Approvals
4. Voltage supply and signal output, electronics
5. Protection rating
6. Measuring range
7. Process and ambient temperature, process pressure
8. Material, wetted parts
9. Hardware and software version
10. Order number
11. Serial number of the instrument
12. Data matrix code for smartphone app
13. Symbol of the device protection class
14. ID numbers, instrument documentation
15. Reminder to observe the instrument documentation

The type label contains the serial number of the instrument. With it you can find the following instrument data on our homepage:

- Product code (HTML)
- Delivery date (HTML)
- Order-specific instrument features (HTML)
- Operating instructions and quick setup guide at the time of shipment (PDF)
- Order-specific sensor data for an electronics exchange (XML)
This operating instructions manual applies to the following instrument versions:
● Hardware version from 1.0.0
● Software version from 1.2.0
● Only for instrument versions without SIL qualification

The instrument and the electronics version can be determined via the product code on the type label as well as on the electronics.
● Standard electronics: Type FX80H.-

The scope of delivery encompasses:
● Sensor
● Documentation
  - Quick setup guide
  - Test certificate measuring accuracy (optional)
  - Supplementary instructions "GSM/GPRS radio module" (optional)
  - Supplementary instructions manual "Heating for display and adjustment module" (optional)
  - Supplementary instructions manual "Plug connector for continuously measuring sensors" (optional)
  - Ex-specific "Safety instructions" (with Ex versions)
  - If necessary, further certificates

Information:
In this operating instructions manual, the optional instrument features are described. The respective scope of delivery results from the order specification.

3.2 Principle of operation
The GWR-2000 is a level sensor with cable or rod probe for continuous level measurement, suitable for applications in bulk solids.

High frequency microwave pulses are guided along a steel cable or a rod. Upon reaching the product surface, the microwave pulses are reflected. The running time is evaluated by the instrument and outputted as level.

Probe end tracking
To increase sensitivity, the probe is equipped with probe end tracking. In bulk solids with a low dielectric constant, this function is very helpful. This is the case, for example, in plastic granules, packing chips or in vessels with fluidized products.

Between a dielectric constant of 1.5 and 3, the function switches on, if required. As soon as the level echo can no longer be detected, probe end tracking is automatically activated. The measurement is continued with the last calculated dielectric constant.

The accuracy thus depends on the stability of the dielectric constant.
If you measure a medium with a dielectric constant below 1.5, probe end tracking is always active. In this case, you have to enter the dielectric constant of the bulk solid. A stable dielectric constant is very important here.

### 3.3 Packaging, transport and storage

Your instrument was protected by packaging during transport. Its capacity to handle normal loads during transport is assured by a test based on ISO 4180.

The packaging of standard instruments consists of environment friendly, recyclable cardboard. For special versions, PE foam or PE foil is also used. Dispose of the packaging material via specialised recycling companies.

Transport must be carried out in due consideration of the notes on the transport packaging. Non-observance of these instructions can cause damage to the device.

The delivery must be checked for completeness and possible transit damage immediately at receipt. Ascertained transit damage or concealed defects must be appropriately dealt with.

Up to the time of installation, the packages must be left closed and stored according to the orientation and storage markings on the outside.

Unless otherwise indicated, the packages must be stored only under the following conditions:
- Not in the open
- Dry and dust free
- Not exposed to corrosive media
- Protected against solar radiation
- Avoiding mechanical shock and vibration
- Storage and transport temperature see chapter “Supplement - Technical data - Ambient conditions”
- Relative humidity 20 … 85 %

### 3.4 Accessories and replacement parts

The display and adjustment module BinDisc is used for measured value indication, adjustment and diagnosis. It can be inserted into the sensor and removed at any time.

You can find further information in the operating instructions “Display and adjustment module BinDisc”.

The protective cover protects the sensor housing against soiling and intense heat from solar radiation.

Screwed flanges are available in different versions according to the following standards: DIN 2501, EN 1092-1, BS 10, ASME B 16.5, JIS B 2210-1984, GOST 12821-80.

The display and adjustment module can be optionally replaced by a display and adjustment module with heating function.

You can use this display and adjustment module in an ambient temperature range of -40…+70 °C.
You can find further information in the operating instructions "Display and adjustment module with heating".

If the standard sensor housing is too big or in case of strong vibrations, an external housing can be used.

Then the sensor housing is made of stainless steel. The electronics is located in the external housing which can be mounted in a distance of up to 10 m (147 ft) to the sensor by using a connection cable.

You can find additional information in the operating instructions manual "External housing".

If you are using an instrument with rod version, you can extend the rod probe individually with curved segments and rod and cable extensions of different lengths.

All extensions used must not exceed a total length of 6 m (19.7 ft).

The extensions are available in the following lengths:

**Rod: ø 16 mm (0.63 in)**
- Basic segments: 20 … 5900 mm (0.79 … 232 in)
- Rod/cable segments: 20 … 5900 mm (0.79 … 232 in)
- Curved segments: 100 x 100 mm (3.94 … 3.94 in)

You can find further information in the operating instructions manual "Rod and cable components".

If you mount the GWR-2000 in a bypass tube or standpipe, you have to avoid contact to the bypass tube by using a spacer at the probe end.

You can find additional information in the operating instructions manual "Centering".
4 Mounting

4.1 General instructions

On instruments with threaded process fitting, the hexagon must be tightened with a suitable wrench. For the proper wrench size see chapter "Dimensions".

⚠️ Warning:
The housing must not be used to screw the instrument in! Applying tightening force can damage internal parts of the housing.

Protect your instrument against moisture ingress through the following measures:
- Use the recommended cable (see chapter “Connecting to power supply”)
- Tighten the cable gland
- When mounting horizontally, turn the housing so that the cable gland points downward
- Loop the connection cable downward in front of the cable gland

This applies mainly to outdoor installations, in areas where humidity is expected (e.g. through cleaning processes) and on cooled or heated vessels.

**Metric threads**

In the case of instrument housings with metric thread, the cable glands are screwed in at the factory. They are sealed with plastic plugs as transport protection.

You have to remove these plugs before electrical connection.

**NPT thread**

In the case of instrument housings with self-sealing NPT threads, it is not possible to have the cable entries screwed in at the factory. The free openings for the cable glands are therefore covered with red dust protection caps as transport protection. The dust protection caps do not provide sufficient protection against moisture.

Prior to setup you have to replace these protective caps with approved cable glands or close the openings with suitable blind plugs.

The mounting position and orientation of the sensor must take into account the limitations in chapter “For your safety”, “Radio approval for USA” “Radio approval for Canada” of this operating instructions.

Make sure that all parts of the instrument exposed to the process are suitable for the existing process conditions.

These are mainly:
- Active measuring component
- Process fitting
- Process seal

Process conditions are particularly:
- Process pressure
- Process temperature
- Chemical properties of the medium
- Abrasion and mechanical influences
You can find detailed information on the process conditions in chapter “Technical data” as well as on the type label.

4.2 Mounting instructions

Mount GWR-2000 in such a way that the distance to vessel installations or to the vessel wall is at least 300 mm (12 in). In non-metallic vessels, the distance to the vessel wall should be at least 500 mm (19.7 in).

During operation, the probe must not touch any installations or the vessel wall. If necessary, fasten the probe end.

In vessels with conical bottom it can be advantageous to mount the sensor in the center of the vessel, as measurement is then possible nearly down to the lowest point of the bottom. Keep in mind that measurement all the way down to the tip of the probe may not be possible. The exact value of the min. distance (lower dead band) is stated in chapter "Technical data".

![Fig. 2: Vessel with conical bottom](image)

**Plastic vessel/Glass vessel**

The guided microwave principle requires a metallic surface on the process fitting. Therefore, in plastic vessels, etc., use an instrument version with flange (from DN 50) or place a metal sheet (Ø > 200 mm/8 in) beneath the process fitting when screwing it in.

Make sure that the plate has direct contact with the process fitting.

When installing the probes without metal vessel wall, e.g. in plastic vessels, the measured value can be influenced by strong electromagnetic fields (emitted interference according to EN 61326: class A).

Use a probe in coax version for applications in liquids.
Fig. 3: Installation in non-metallic vessel
1  Flange
2  Metal sheet

Concrete vessel
When installed in thick concrete ceilings, GWR-2000 should be mounted front flush to the lower edge. In concrete silos, the distance to the wall should be at least 500 mm (20 in).

Fig. 4: Installation in concrete silo

If possible, avoid sockets. Mount the sensor flush with the vessel top. If this is not possible, use short sockets with small diameter.
Higher sockets or sockets with a bigger diameter can generally be used. They can, however, increase the upper blocking distance (dead band). Check if this is relevant for your measurement.

In such cases, always carry out a false signal suppression after installation. You can find further information under "Setup procedure".

When welding the socket, make sure that the socket is flush with the vessel top.

Before beginning the welding work, remove the electronics module from the sensor. By doing this, you avoid damage to the electronics through inductive coupling.

Do not mount the instruments in or above the filling stream. Make sure that you detect the product surface, not the inflowing product.
The reference plane for the measuring range of the sensors is the sealing surface of the thread or flange.

Keep in mind that a min. distance must be maintained below the reference plane and possibly also at the end of the probe - measurement in these areas is not possible (dead band). The length of the cable can be used all the way to the end only when measuring conductive products. These blocking distances for different mediums are listed in chapter "Technical data". Keep in mind for the adjustment that the default setting for the measuring range refers to water.

The process fitting must be sealed if there is gauge or low pressure in the vessel. Before use, check if the seal material is resistant against the measured product and the process temperature.

The max. permissible pressure is specified in chapter "Technical data" or on the type label of the sensor.

If there is a risk of the cable probe touching the vessel wall during operation due to product movements or agitators, etc., the measuring probe should be securely fixed.

In the gravity weight there is an internal thread (M12), e.g. for an eyebolt (optional) - (article no. 2.27423).

Make sure that the probe cable is not completely taut. Avoid tensile loads on the cable.

Avoid undefined vessel connections, i.e. the connection must be either grounded reliably or isolated reliably. Any undefined change of this condition can lead to measurement errors.

If there is a danger of the rod probe touching the vessel wall, then the probe must be fastened at the bottom end.

Keep in mind that below the fastening, a measurement is not possible.
In case of difficult installation conditions in liquid applications, the probe can be also mounted laterally. For this purpose, adapt the rod with rod extensions or bow-shaped segments.

To compensate for the resulting changes in signal runtime, let the instrument determine the probe length automatically.

The determined probe length can deviate from the actual probe length when using curved or angled segments.

If internal installations such as struts, ladders, etc. are present on the vessel wall, the measuring probe should be mounted at least 300 mm (11.81 in) away from the vessel wall.

You can find further information in the supplementary instructions of the rod extension.

In case of difficult installation conditions, for example in a socket, the probe can be suitably adapted with a rod extension.

To compensate for the resulting changes in signal runtime, let the instrument determine the probe length automatically.

You can find further information in the supplementary instructions of the rod and cable components.
5 Connecting to power supply

5.1 Preparing the connection

Always keep in mind the following safety instructions:

⚠️ Warning:
Connect only in the complete absence of line voltage.
- The electrical connection must only be carried out by trained personnel authorized by the plant operator.
- If overvoltage surges are expected, overvoltage arresters should be installed.

Voltage supply
Power supply and current signal are carried on the same two-wire cable. The operating voltage can differ depending on the instrument version.

The data for power supply are specified in chapter "Technical data". Provide a reliable separation between the supply circuit and the mains circuits according to DIN EN 61140 VDE 0140-1.

Keep in mind the following additional factors that influence the operating voltage:
- Lower output voltage of the power supply unit under nominal load (e.g. with a sensor current of 20.5 mA or 22 mA in case of fault)
- Influence of additional instruments in the circuit (see load values in chapter "Technical data")

Connection Cable
The instrument is connected with standard two-wire cable without screen. If electromagnetic interference is expected which is above the test values of EN 61326-1 for industrial areas, screened cable should be used.

We generally recommend the use of screened cable for HART multidrop mode.

Use cable with round cross section for instruments with housing and cable gland. To ensure the seal effect of the cable gland (IP protection rating), find out which cable outer diameter the cable gland is suitable for.

Use a cable gland fitting the cable diameter.

Metric threads
In the case of instrument housings with metric thread, the cable glands are screwed in at the factory. They are sealed with plastic plugs as transport protection.

You have to remove these plugs before electrical connection.

NPT thread
In the case of instrument housings with self-sealing NPT threads, it is not possible to have the cable entries screwed in at the factory. The free openings for the cable glands are therefore covered with red dust protection caps as transport protection.

Prior to setup you have to replace these protective caps with approved cable glands or close the openings with suitable blind plugs.

With plastic housing, the NPT cable gland or the Conduit steel tube must be screwed without...
5 Connecting to power supply

grease into the threaded insert.

Max. torque for all housings, see chapter "Technical data".

If screened cable is required, we recommend connecting the cable screen on both ends to ground potential. In the sensor, the screen should be connected directly to the internal ground terminal. The ground terminal on the outside of the housing must be connected to the ground potential (with low impedance).

In Ex systems, the grounding is carried out according to the installation regulations.

In electroplating and CCP systems (cathodic corrosion protection) it must be taken into account that significant potential differences exist. This can lead to unacceptably high currents in the cable screen if it is grounded at both ends.

**Information:**
The metallic parts of the instrument (process fitting, sensor, concentric tube, etc.) are connected with the internal and external ground terminal on the housing. This connection exists either directly via the conductive metallic parts or, in case of instruments with external electronics, via the screen of the special connection cable.

You can find specifications on the potential connections inside the instrument in chapter "Technical data".

5.2 Connection

The voltage supply and signal output are connected via the spring loaded terminals in the housing.

Connection to the display and adjustment module or to the interface adapter is carried out via contact pins in the housing.

**Information:**
The terminal block is pluggable and can be removed from the electronics. To do this, lift the terminal block with a small screwdriver and pull it out. When reinserting the terminal block, you should hear it snap in.

Proceed as follows:
1. Unscrew the housing lid
2. If a display and adjustment module is installed, remove it by turning it slightly to the left.
3. Loosen compression nut of the cable gland and remove blind plug
4. Remove approx. 10 cm (4 in) of the cable mantle (signal output), strip approx. 1 cm (0.4 in) insulation from the ends of the individual wires
5. Insert the cable into the sensor through the cable entry
5 Connecting to power supply

6. Insert the wire ends into the terminals according to the wiring plan

**Information:**
Solid cores as well as flexible cores with wire end sleeves are inserted directly into the terminal openings. In case of flexible cores without end sleeves, press the terminal from above with a small screwdriver, the terminal opening is then free. When the screwdriver is released, the terminal closes again.

7. Check the hold of the wires in the terminals by lightly pulling on them

8. Connect the screen to the internal ground terminal, connect the outer ground terminal to potential equalisation in case of power supply via low voltage

9. Connect the lead cable for power supply in the same way according to the wiring plan, in addition connect the ground conductor to the inner ground terminal when powered with mains voltage.

Fig. 9: Connection steps 5 and 6 - Single chamber housing

Fig. 10: Connection steps 5 and 6

GWR-2000 Two-wire 4-20 mA/HART 925-0345 Rev B
10. Tighten the compression nut of the cable glands. The seal ring must completely encircle the cables.

11. Screw the housing lid back on.

The electrical connection is finished.

### 5.3 Wiring plan, single chamber housing

The following illustration applies to the non-Ex, Ex-ia and Ex-d-ia version.

![Wiring plan, single chamber housing](image)

5.8 Supplementary electronics

To make a second measured value available for use, you can use the supplementary electronics - additional current output.

Both current outputs are passive and need a power supply.

The radio module PLICSMOBILE is an external GSM/GPRS radio unit for transmission of measured values and for remote parameter adjustment.
5 Connecting to power supply

![Diagram of radio module integrated in the connection compartment]

Fig. 23: Radio module PLICSMOBILE integrated in the connection compartment

1 Voltage supply

You can find detailed information on connection in the supplementary instructions "PLICSMOBILE GSM/GPRS radio module".

5.9 Switch-on phase

After connecting the instrument to power supply or after a voltage recurrence, the instrument carries out a self-check for approx. 30 s:

- Internal check of the electronics
- Indication of the instrument type, hardware and software version, measurement loop name on the display or PC
- Indication of the status message "F 105 Determine measured value" on the display or PC
- The output signal jumps to the set fault current

As soon as a plausible measured value is found, the corresponding current is outputted to the signal cable. The value corresponds to the actual level as well as the settings already carried out, e.g. factory setting.
6 Set up the sensor with the display and adjustment module

6.1 Insert display and adjustment module

The display and adjustment module can be inserted into the sensor and removed again at any time. You can choose any one of four different positions - each displaced by 90°. It is not necessary to interrupt the power supply.

Proceed as follows:
1. Unscrew the housing lid
2. Place the display and adjustment module on the electronics in the desired position and turn it to the right until it snaps in.
3. Screw housing lid with inspection window tightly back on

Disassembly is carried out in reverse order.

The display and adjustment module is powered by the sensor, an additional connection is not necessary.

Fig. 24: Installing the display and adjustment module in the electronics compartment of the single chamber housing
Fig. 25: Installing the display and adjustment module in the double chamber housing
1  In the electronics compartment
2  In the terminal compartment

Note:
If you intend to retrofit the instrument with a display and adjustment module for continuous measured value indication, a higher lid with an inspection glass is required.

6.2 Adjustment system

Fig. 26: Display and adjustment elements
1  LC display
2  Adjustment keys
• **[OK]** key:
  - Move to the menu overview
  - Confirm selected menu
  - Edit parameter
  - Save value

• **[->]** key:
  - Change measured value presentation
  - Select list entry
  - Select menu items in the quick setup menu
  - Select editing position

• **[+]** key:
  - Change value of the parameter

• **[ESC]** key:
  - Interrupt input
  - Jump to next higher menu

You adjust the sensor via the four keys of the display and adjustment module. The individual menu items are shown on the LC display. You can find the functions of the individual keys in the previous illustration.

When the **[+]** and **[->]** keys are pressed quickly, the edited value, or the cursor, changes one value or position at a time. If the key is pressed longer than 1 s, the value or position changes continuously.

When the **[OK]** and **[ESC]** keys are pressed simultaneously for more than 5 s, the display returns to the main menu. The menu language is then switched over to "English".

Approx. 60 minutes after the last pressing of a key, an automatic reset to measured value indication is triggered. Any values not confirmed with **[OK]** will not be saved.

After switching on, the GWR-2000 carries out a short self-test where the device software is checked.

The output signal transmits a fault signal during the switch-on phase. The following information is displayed on the display and adjustment module during the startup procedure:

• Instrument type
• Device name
• Software version (SW-Ver)
• Hardware version (HW-Ver)

With the **[->]** key you can move between three different indication modes.

In the first view, the selected measured value is displayed in large digits.

In the second view, the selected measured value and a corresponding bar graph presentation are displayed.

In the third view, the selected measured value as well as a second selectable value, e.g. the temperature, are displayed.
6.3 Parameter adjustment - Quick setup

To quickly and easily adapt the sensor to the application, select the menu item "Quick setup" in the start graphic on the display and adjustment module.

The following steps for the quick setup can be reached also in the "Extended adjustment".

- Instrument address
- Measurement loop name
- Medium type (optional)
- Application
- Max. adjustment
- Min. adjustment
- False signal suppression

You can find the description of the individual menu items in the following chapter "Parameter adjustment - Extended adjustment".

6.4 Parameter adjustment - Extended adjustment

For technically demanding measuring points, you can carry out extended settings in "Extended adjustment".

The main menu is divided into five sections with the following functions:

**Setup:** Settings, e.g. measurement loop name, medium, vessel, adjustment, signal output, device unit, false signal suppression, linearization curve

**Display:** Settings, e.g., for language, measured value display, lighting

**Diagnosis:** Information, e.g. on instrument status, pointer, measurement certainty, simulation, echo curve

**Additional adjustments:** Reset, date/time, reset, copy function

**Info:** Instrument name, hardware and software version, date of manufacture, instrument features
Note:
For optimum adjustment of the measuring point, the individual submenu items in the main menu item "Setup" should be selected one after the other and provided with the correct parameters. If possible, go through the items in the given sequence.

The procedure is described below.

The following submenu points are available:

- **Measurement loop name**
- **Units**
- **Probe length**
- **Adjustment level**
- **Setup interface**
- **Calibration**
- **Current output**
- **False signal suppression**
- **Linearization**
- **Look adjustment**

The submenu points described below.

Here you can assign a suitable measurement loop name. Push the "OK" key to start the editing. With the "+" key you change the sign and with the "->" key you jump to the next position.

You can enter names with max. 19 characters. The character set comprises:
- Capital letters from A ... Z
- Numbers from 0 ... 9
- Special characters + - / _ blanks

In the "Units" menu item you select the distance unit and the temperature unit.

For the distance units you can choose between m, mm and ft and for the temperature units °C, °F and K.

In the "Probe length" menu item you can enter the probe length or have the length determined automatically by the sensor system.

When choosing "Yes", then the probe length will be determined automatically. When choosing "No", you can enter the probe length manually.

In the "Application - Type of medium" menu item you can select which type of medium you want to measure. You can choose between liquid or bulk solid.
In the "Application" menu item you can select the application. You can choose between metallic or non-metallic vessels.

**Note:**
The selection of the application has a considerable influence on all other menu items. Keep in mind that as you continue with the parameter adjustment, individual menu items are only optionally available.

You have the option of choosing the demonstration mode. This mode is only suitable for test and demonstration purposes. In this mode, the sensor ignores the parameters of the application and reacts immediately to any change.

In the "Medium, dielectric constant" menu item, you can define the type of medium (product).

This menu item is only available if you have selected level measurement under the menu item "Application".

You can choose between the following medium types:

<table>
<thead>
<tr>
<th>Dielectric constant</th>
<th>Product type</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;3</td>
<td>Cereals, flour</td>
<td>All kind of cereals, wheat flour</td>
</tr>
<tr>
<td>1.5 ... 3</td>
<td>Granules, cement</td>
<td>Lime, gypsum, cement</td>
</tr>
<tr>
<td>&lt;1.5</td>
<td>Dusts, wood chips</td>
<td>Wood chips, sawdust</td>
</tr>
</tbody>
</table>

In the "Max. adjustment Level" menu item, you can enter the max. adjustment for the level.

Adjust the requested percentage value with [+] and store with [OK].
Enter the appropriate distance value in m (corresponding to the percentage value) for the full vessel. The distance refers to the sensor reference plane (seal surface of the process fitting). Keep in mind that the max. level must lie below the dead band. Enter the appropriate distance value in m (corresponding to the percentage value) for the full vessel. The distance refers to the sensor reference plane (seal surface of the process fitting). Keep in mind that the max. level must lie below the dead band.

In the "Min. adjustment Level" menu item, you can enter the min. adjustment for the level.

Adjust the requested percentage value with [+ ] and store with [OK].

Enter the suitable distance value in m for the empty vessel (e.g. distance from the flange to the probe end) corresponding to the percentage value. The distance refers to the sensor reference plane (seal surface of the process fitting).

To damp process-dependent measured value fluctuations, set an integration time of 0 … 999 s in this menu item.

The default setting is a damping of 0 s.

A linearization is necessary for all vessels in which the vessel volume does not increase linearly with the level - e.g. a horizontal cylindrical or spherical tank, when the indication or output of the volume is required. Corresponding linearization curves are preprogrammed for these vessels. They represent the correlation between the level percentage and vessel volume.

The linearization applies to the measured value indication and the current output. By activating the appropriate curve, the volume percentage of the vessel is displayed correctly. If the volume should not be displayed in percent but e.g. in l or kg, a scaling can be also set in the menu item "Display".
Warning:
If a linearisation curve is selected, the measuring signal is no longer necessarily linear to the filling height. This must be considered by the user especially when adjusting the switching point on the limit signal transmitter.

In the following, you have to enter the values for your vessel, for example the vessel height and the socket correction.

For non-linear vessel forms, enter the vessel height and the socket correction.

For the vessel height, you have to enter the total height of the vessel.

For the socket correction you have to enter the height of the socket above the upper edge of the vessel. If the socket is lower than the upper edge of the vessel, this value can also be negative.

![Diagram of vessel with linearisation curves]

Fig. 27: Vessel height and socket correction value

- $D$: Vessel height
- $+h$: Positive socket correction value
- $-h$: Negative socket correction value
6 Set up with the display and adjustment module

In the "Current output mode" menu item you determine the output characteristics and reaction of the current output in case of failure.

The default setting is output characteristics 4 ... 20 mA, failure mode < 3.6 mA.

In the "Current output Min./Max." menu item, you determine the reaction of the current output during operation.

The default setting is min. current 3.8 mA and max. current 20.5 mA.

The following circumstances cause interfering reflections and can influence the measurement:
- High sockets
- Vessel internals such as struts
- Deflectors, etc.

**Note:**
A false signal suppression is only recommended with liquid applications.

A false signal suppression detects, marks and saves these false signals so that they are no longer taken into account in the level measurement.

This should be done with the lowest possible level so that all potential interfering reflections can be detected.

Proceed as follows:

Enter the actual distance from the sensor to the product surface.

All interfering signals in this section are detected by the sensor and stored.
6 Set up with the display and adjustment module

Note:
Check the distance to the product surface, because if an incorrect (too large) value is entered, the existing level will be saved as a false signal. The level would then no longer be detectable in this area.

If a false signal suppression has already been created in the sensor, the following menu window appears when selecting "False signal suppression":

The instrument carries out an automatic false signal suppression as soon as the probe is uncovered. The false signal suppression is always updated.

The "Delete" menu item is used to completely delete an already created false signal suppression. This is useful if the saved false signal suppression no longer matches the metrological conditions in the vessel.

In the "Lock/unlock adjustment" menu item, you can protect the sensor parameters against unauthorized or inadvertent modification. The PIN is activated/deactivated permanently.

With active PIN, only the following adjustment functions are possible without entering a PIN:
● Select menu items and show data
● Read data from the sensor into the display and adjustment module.

Caution:
With active PIN, adjustment via PACTware/DTM as well as other systems is also blocked.

You can change the PIN number under "Additional settings - PIN".

If a supplementary electronics with an additional current output is installed in the instrument, you can adjust the additional current output separately.

In the "Current output 2" menu item you specify which measured value the additional current output refers to.

The procedure corresponds to the previous settings of the standard current output. See "Setup - Current output".

In the main menu point "Display", the individual submenu points should be selected subsequently and provided with the correct parameters to ensure the optimum adjustment of the display options. The procedure is described in the following.
The following submenu points are available:

The submenu points described below.

The "Menu language" menu item enables the setting of the requested national language.

In the delivery status, the sensor is set to the ordered national language.

In the "Indication value 1" menu item, you define the indication of the measured value on the display. You can display two different measured values. In this menu item, you define measured value 1.

The default setting for the displayed value 1 is "Filling height Level".

In the "Indication value 2" menu item, you define the indication of the measured value on the display. You can display two different measured values. In this menu item, you define measured value 2.

The default setting for the displayed value 2 is the electronics temperature.

The integrated background lighting can be switched off via the adjustment menu. The function depends on the strength of the supply voltage, see "Technical data".

In delivery status, the lighting is switched on.

In the "Device status" menu item, the device status is displayed.
The respective min. and max. measured value is saved in the sensor. The two values are displayed in the menu item "Peak values, distance".

In another window you can reset the peak value.

The respective min. and max. measured values are saved in the sensor. The two values are displayed in the menu item "Peak values, measurement certainty".

The measurement can be influenced by the process conditions. In this menu item, the measurement certainty of the level measurement is displayed as percentage value. The higher the value, the more reliable the measurement. Values > 90 % indicate reliable measurement.

In another window you can reset the peak value.

The respective min. and max. measured values are saved in the sensor. The values are displayed in the menu item "Peak values Additional".

This menu item displays the peak values of the electronics temperature as well as the dielectric constant.

In another window you can carry out a reset of the two peak values separately.
The "Echo curve" menu item shows the signal strength of the echoes over the measuring range in V. The signal strength enables an evaluation of the quality of the measurement.

With the following functions you can zoom part sections of the echo curve.

- "X-Zoom": Zoom function for the meas. distance
- "Y-Zoom": 1, 2, 5 and 10x signal magnification in "V"
- "Unzoom": Reset the presentation to the nominal measuring range without magnification

In the "Simulation" menu item you can simulate measured values via the current output. This allows the signal path to be tested, e.g. through downstream indicating instruments or the input card of the control system.

Select the requested simulation variable and set the requested value.

**Caution:**
During simulation, the simulated value is outputted as 4 ... 20 mA current value and digital HART signal.

Push the [ESC] key to deactivate the simulation.

**Information:**
The simulation is terminated automatically 60 minutes after the activation of the simulation.

With the menu item "Setup" the echo curve it is possible to save at the time of setup. This is generally recommended; for using the Asset Management functions it is necessary. If possible, the curve should be saved with a low level in the vessel.

With this, you can detect signal changes over the operating time. With the adjustment software PACTware and the PC, the high-resolution echo curve can be displayed and used to compare the echo curve of the setup with the actual echo curve.

The function "Echo curve memory" enables storing echo curves of the measurement.

Under the sub-menu item "Echo curve memory" you can store the current echo curve.
Parameter settings for recording the echo curve and the settings of the echo curve itself can be carried out in the adjustment software PACTware.

With the adjustment software PACTware and the PC the high-resolution echo curve can be displayed and used later on to assess the quality of the measurement.

In the "Date/Time" menu item, the internal clock of the sensor is adjusted.

With a reset, certain parameter adjustments carried out by the user are reset.

The following reset functions are available:

**Delivery status**: Restoring the parameter settings at the time of shipment from the factory incl. the order-specific settings. A created false signal suppression, user-programmable linearization curve as well as the measured value memory will be deleted.

**Basic settings**: Resetting of the parameter settings, incl. special parameters, to the default values of the respective instrument. Any stored false signal suppression or user programmable linearisation curve, as well as the measured value memory, is deleted.

The following table shows the default values of the instrument. Depending on the instrument version or application, all menu items may not be available or some may be differently assigned:

The instrument settings are copied with this function. The following functions are available:

- Read from sensor: Read data from sensor and save in the display and adjustment module
- Write to sensor: Save data from the display and adjustment module back into the sensor

The following data or settings for adjustment of the display and adjustment module are saved:

- All data of the menu "Setup" and "Display"
- In the menu "Additional adjustments" the items "Reset, Date/Time"
- Special parameters

The copied data are permanently saved in an EEPROM memory in the display and adjustment module and remain there even in case of power failure. From there, they can be written into one or more sensors or kept as backup for a possible electronics exchange.

**Note:**
Before the data are stored in the sensor, a check is carried out to determine if the data fit the sensor. If the data do not fit, a fault signal is triggered or the function is blocked. When data are being written into the sensor, the display shows which instrument type the data originate from and which TAG-no. this sensor had.

Since scaling is very extensive, scaling of the level value was divided into two menu items.

### Level 1

In the "Level 1" menu item you define the scaling variable and the scaling unit for the level value on the display, e.g. volume in l.

### Level 2

In the "Level 2" menu item you define the scaling format on the display and the scaling of the measured level value for 0 % and 100 %.
In the "Current output, variable" menu item you specify which measured variable the current output refers to.

In the "Current output, adjustment" menu item you can assign a respective measured value to the current output.

In the "Probe type" menu item you can select the type and size of your probe from a list of all possible probes. This is necessary to adapt the electronics optimally to the probe.

The sensor offers the HART modes "Analogue current output" and "Fix current (4 mA)". In this menu item you determine the HART mode and enter the address with Multidrop mode.

In the mode "Fixed current output" up to 63 sensors can be operated on one two-wire cable (Multidrop operation). An address between 0 and 63 must be assigned to each sensor.

If you select the function "Analogue current output" and also enter an address number, you can output a 4 … 20 mA signal in Multidrop mode.

In the mode "Fixed current (4 mA)" a fixed 4 mA signal is output independently of the actual level.

The default setting is "Analogue current output" and the address 00.

In the "Special parameters" menu item you gain access to the protected area where you can enter special parameters. In exceptional cases, individual parameters can be modified in order to adapt the sensor to special requirements.

Change the settings of the special parameters only after having contacted our service staff.

In the "Instrument name" menu, you read out the instrument name and the instrument serial number.
In the "Instrument version" menu item, the hardware and software version of the sensor is displayed.

![Software version](1.0.0)

In the "Factory calibration date" menu item, the date of factory calibration of the sensor as well as the date of the last change of sensor parameters are displayed via the display and adjustment module or via the PC.

![Factory calibration date](3. Aug 2012)

In the "Sensor characteristics" menu item, the features of the sensor such as approval, process fitting, seal, measuring range, electronics, housing and others are displayed.

![Sensor characteristics](Display now?)

### 6.5 Saving the parameter adjustment data

We recommended noting the adjusted data, e.g. in this operating instructions manual, and archiving them afterwards. They are thus available for multiple use or service purposes.

If the instrument is equipped with a display and adjustment module, the data in the sensor can be saved in the display and adjustment module. The procedure is described in the menu "Additional adjustments" in the menu item "Copy sensor data". The data remain there permanently even if the sensor power supply fails.

The following data or settings for adjustment of the display and adjustment module are saved:

- All data of the menu "Setup" and "Display"
- In the menu "Additional settings" the items "Sensor-specific units, temperature unit and linearization"
- The values of the user programmable linearization curve

The function can also be used to transfer settings from one instrument to another instrument of the same type. If it is necessary to exchange a sensor, the display and adjustment module is inserted into the replacement instrument and the data are likewise written into the sensor via the menu item "Copy sensor data".
7 Setting up sensor and Modbus interface with PACTware

7 Setup with PACTware

7.1 Connect the PC

Fig. 28: Connection of the PC directly to the sensor via the interface adapter
1 USB cable to the PC
2 Interface adapter BinDisc
3 Sensor

Fig. 29: Connecting the PC via HART to the signal cable
1 GWR-2000
2 HART resistance 250 Ω (optional depending on evaluation)
3 Connection cable with 2 mm pins and terminals
4 Processing system/PLC/Voltage supply
5 Interface adapter, for example BinDisc
7 Setting up sensor and Modbus interface with PACTware

Note:
With power supply units with integrated HART resistance (internal resistance approx. 250 Ω), an additional external resistance is not necessary. Commercially available Ex separators are also usually equipped with sufficient current limitation resistance. In such cases, interface adapter can be connected parallel to the 4 … 20 mA cable.

7.2 Parameter adjustment

For parameter adjustment of the instrument via a Windows PC, the configuration software PACTware and a suitable instrument driver (DTM) according to FDT standard are required. The latest PACTware version as well as all available DTMs are compiled in a DTM Collection. The DTMs can also be integrated into other frame applications according to FDT standard.

Note:
To ensure that all instrument functions are supported, you should always use the latest DTM Collection. Furthermore, not all described functions are included in older firmware versions. You can download the latest instrument software from our homepage. A description of the update procedure is also available in the Internet.

Further setup steps are described in the operating instructions manual "DTM Collection/ PACTware" attached to each DTM Collection and which can also be downloaded from the Internet. Detailed descriptions are available in the online help of PACTware and the DTMs.

All device DTMs are available as a free-of-charge standard version and as a full version that must be purchased. In the standard version, all functions for complete setup are already included. An assistant for simple project configuration simplifies the adjustment considerably. Saving/printing the project as well as import/export functions are also part of the standard version.
In the full version there is also an extended print function for complete project documentation as well as a save function for measured value and echo curves. In addition, there is a tank calculation program as well as a multiviewer for display and analysis of the saved measured value and echo curves.

7.3 Set up with the quick setup

The quick setup is another option for parameter adjustment of the sensor. It allows fast, convenient adjustment of the most important parameters to adapt the sensor quickly to standard applications. To use it, select the function "Quick setup" in the start screen.

**Quick setup**

With quick setup you can carry out the parameter adjustment of GWR-2000 for your application in just a few simple steps. The assistant-driven adjustment includes the basic settings for simple, reliable setup and commissioning.

**Information:**
If the function is inactive, then possibly no instrument is connected. Check the connection to the instrument.

**Extended adjustment**

With the extended adjustment, you carry out the parameter adjustment for the instrument via the clear menu structure in the DTM (Device Type Manager). This enables additional and special settings over and above those offered by quick setup.

**Maintenance**

Under the menu item "Maintenance" you get comprehensive and important support for servicing and maintenance. You can call up diagnostic functions and carry out an electronics exchange or a software update.

Click to the button "Quick setup", to start the assistant-driven adjustment for a simplified and reliable setup.

7.4 Saving the parameter adjustment data

We recommend documenting or saving the parameter adjustment data via PACTware. That way the data are available for multiple use or service purposes.
8 Set up with other systems

8.1 DD adjustment programs
Device descriptions as Enhanced Device Description (EDD) are available for DD adjustment programs such as, for example, AMS™ and PDM.

8.2 Field Communicator 375, 475
Device descriptions for the instrument are available as EDD for parameter adjustment with the Field Communicator 375 or 475.

For the integration of the EDD in the Field Communicator 375 or 475, the software "Easy Upgrade Utility" is required which is available from the manufacturer. This software is updated via the Internet and new EDDs are automatically taken over into the device catalogue of this software after they are released by the manufacturer. They can then be transferred to a Field Communicator.
9  Diagnostics and servicing

9.1  Maintenance

If the instrument is used correctly, no maintenance is required in normal operation.

9.2  Measured value and event memory

The instrument has several memories which are available for diagnostic purposes. The data remain there even in case of voltage interruption.

Up to 100,000 measured values can be stored in the sensor in a ring memory. Each entry contains date/time as well as the respective measured value. Storable values are for example:

- Distance
- Filling height
- Percentage value
- Lin. percent
- Scaled
- Current value
- Meas. certainty
- Electronics temperature

When the instrument is shipped, the measured value memory is active and stores distance, measurement certainty and electronics temperature every 3 minutes.

In "Extended adjustment" you can select the respective measured values.

The requested values and recording conditions are set via a PC with PACTware/DTM or the control system with EDD. Data are thus read out and also reset.

Up to 500 events are automatically stored with a time stamp in the sensor (non-deletable). Each entry contains date/time, event type, event description and value. Event types are for example:

- Modification of a parameter
- Switch-on and switch-off times
- Status messages (according to NE 107)
- Error messages (according to NE 107)

The data are read out via a PC with PACTware/DTM or the control system with EDD.

The echo curves are stored with date and time and the corresponding echo data. The memory is divided into two sections:

**Echo curve of the setup**: This is used as reference echo curve for the measurement conditions during setup. Changes in the measurement conditions during operation or buildup on the sensor can thus be recognized. The echo curve of the setup is stored via:

- PC with PACTware/DTM
- Control system with EDD
- Display and adjustment module
Further echo curves: Up to 10 echo curves can be stored in a ring buffer in this memory section. Further echo curves are stored via:

- PC with PACTware/DTM
- Control system with EDD
- Display and adjustment module

9.3 Status messages

The instrument features self-monitoring and diagnostics according to NE 107 and VDI/VDE 2650. In addition to the status messages in the following tables, detailed error messages are available under menu item "Diagnostics" via the display and adjustment module, PACTware/DTM and EDD.

The status messages are divided into the following categories:

- Failure
- Function check
- Out of specification
- Maintenance requirement

and explained by pictographs:

Fig. 36: Pictographs of the status messages

1. Failure - red
2. Out of specification - yellow
3. Function check - orange
4. Maintenance - blue

Failure: Due to a malfunction in the instrument, a failure message is outputted.

This status message is always active. It cannot be deactivated by the user.

Function check: The instrument is in operation; the measured value is temporarily invalid (for example during simulation).

This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

Out of specification: The measured value is unstable because the instrument specification is exceeded (e.g. electronics temperature).

This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

Maintenance: Due to external influences, the instrument function is limited. The measurement is affected, but the measured value is still valid. Plan in maintenance for the instrument because
a failure is expected in the near future (e.g. due to buildup). This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

The following table shows the error codes in the status message "Failure" and gives information on the reason and rectification. Keep in mind that some information is only valid with four-wire instruments.

<table>

### 9.4 Rectify faults

The operator of the system is responsible for taking suitable measures to rectify faults.

The first measures are:
- Evaluation of fault messages, for example via the display and adjustment module
- Checking the output signal
- Treatment of measurement errors

Further comprehensive diagnostics options are available with a PC with PACTware and the suitable DTM. In many cases, the reasons can be determined in this way and faults rectified.

Connect a multimeter in the suitable measuring range according to the wiring plan. The following table describes possible errors in the current signal and helps to eliminate them:

<table>
<thead>
<tr>
<th>Error</th>
<th>Cause</th>
<th>Rectification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 … 20 mA signal not stable</td>
<td>- Fluctuations of the measured variable</td>
<td>- Set damping appropriate to the instrument via the display and adjustment module or PACTware/DTM</td>
</tr>
<tr>
<td>4 … 20 mA signal missing</td>
<td>- Electrical connection faulty</td>
<td>- Check connection according to chapter &quot;Connection steps&quot; and if necessary, correct according to chapter &quot;Wiring plan&quot;</td>
</tr>
<tr>
<td></td>
<td>- Voltage supply missing</td>
<td>- Check cables for breaks; repair if necessary</td>
</tr>
<tr>
<td>Current signal greater than 22 mA or less than 3.6 mA</td>
<td>- Electronics module in the sensor defective</td>
<td>- Check, adapt if necessary</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Exchange the instrument or send it in for repair</td>
</tr>
</tbody>
</table>

The below tables show typical examples of application-related measurement errors with bulk solids. A distinction is made between measurement errors during:
- Constant level
- Filling
- Emptying

The images in column "Error pattern" show the real level as a broken line and the level displayed by the sensor as a continuous line.
9 Diagnosis, asset management and service

Note:
- Whenever the sensor displays a constant value, the reason could also be that the fault setting of the current output is set to "Hold value"
- If the level indication is too low, the reason could be a line resistance that is too high

### Measurement error with constant level

<table>
<thead>
<tr>
<th>Fault description</th>
<th>Error pattern</th>
<th>Cause</th>
<th>Rectification</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Measured value shows a too low or too high level</td>
<td><img src="image1" alt="Graph" /></td>
<td>- Min./max. adjustment not correct</td>
<td>- Adapt min./max. adjustment</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Incorrect linearization curve</td>
<td>- Adapt linearization curve</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Running time error (small measurement error close to 100 %/serious error close to 0 %)</td>
<td>- Repeat setup</td>
</tr>
<tr>
<td>2. Measured value jumps towards 100 %</td>
<td><img src="image2" alt="Graph" /></td>
<td>- Due to the process, the amplitude of the product echo decreases - A false signal suppression was not carried out</td>
<td>- Carry out a false signal suppression</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Amplitude or position of a false signal has changed (e.g. buildup); false signal suppression no longer matches</td>
<td>- Determine the reason for the changed false signals, carry out false signal suppression, e.g. with buildup</td>
</tr>
</tbody>
</table>

### Measurement error during filling

<table>
<thead>
<tr>
<th>Fault description</th>
<th>Error pattern</th>
<th>Cause</th>
<th>Rectification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3. Measured value remains in the area of the bottom during filling</td>
<td><img src="image3" alt="Graph" /></td>
<td>- Echo from the probe end larger than the product echo, for example, with products with ( \varepsilon r &lt; 2.5 ) oil-based, solvents, etc.</td>
<td>- Check parameter &quot;Medium&quot; and &quot;Vessel height&quot;, adapt if necessary</td>
</tr>
<tr>
<td>4. Measured value remains momentarily unchanged during filling and then jumps to the correct level</td>
<td><img src="image4" alt="Graph" /></td>
<td>- Turbulence on the product surface, quick filling</td>
<td>- Check parameters, change if necessary, e.g. in dosing vessel, reactor</td>
</tr>
</tbody>
</table>
### Fault description

<table>
<thead>
<tr>
<th>Measurement error during emptying</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Fault description</strong></td>
</tr>
</tbody>
</table>
| 7. Measured value remains unchanged in the close range during emptying |  | False signal larger than the level echo  
- Level echo too small | Eliminate false signals in the close range  
- Remove contamination on the probe. After having removed the source of the false signals, the false signal suppression must be deleted.  
- Carry out a new false signal suppression |
| 8. Measured value remains reproducible in one position during emptying |  | Stored false signals in this position are larger than the level echo | Delete false signal suppression  
- Carry out a new false signal suppression |

Depending on the reason for the fault and the measures taken, the steps described in chapter "Setup" must be carried out again or must be checked for plausibility and completeness.

### 9.5 Exchanging the electronics module

If the electronics module is defective, it can be replaced by the user.

In Ex applications, only instruments and electronics modules with appropriate Ex approval may be used.

If there is no electronics module available on site, the electronics module can be ordered through the agency serving you. The electronics modules are adapted to the respective sensor and differ in signal output or voltage supply.

The new electronics module must be loaded with the default settings of the sensor. These are the options:
- In the factory
- Or on site by the user
In both cases, the serial number of the sensor is needed. The serial numbers are stated on the type label of the instrument, on the inside of the housing as well as on the delivery note.

When loading on site, first of all the order data must be downloaded from the Internet (see operating instructions manual "Electronics module").

Caution:
All user-specific settings must be entered again. Hence, you have to carry out a new setup after the electronics exchange.

If you have stored the data of the parameter adjustment during the first setup of the sensor, you can transfer these to the replacement electronics module. A new setup is no longer necessary.

9.6 Exchange or shorten cable/rod
The cable or rod (meas. part) of the probe can be shortened, if necessary. To loosen the rod or cable you need a fork spanner with spanner width 13.

1. Loosen the rod or cable by applying a fork spanner to the flat surfaces (SW 13), provide counterforce with another fork spanner (SW 13)
2. Unscrew the loosened rod or cable manually.
3. Place the enclosed new double washer onto the thread.

Caution:
Make sure that the two components of the double washer remain together.

4. Screw the new rod and the new cable manually to the thread on the process fitting.
5. Exert counterforce with the second fork spanner and tighten the measuring rod or cable on the flat surfaces with a torque of 20 Nm (15 lbf ft).
Information:
Please maintain the specified torque so that the max. tensile strength of the connection remains.

6. Enter new probe length and if necessary the new probe type and then carry out a fresh adjustment (see "Setup procedure, Carrying out min. adjustment - Carrying out max. adjustment").

The rod or cable of the probe can be shortened individually.
1. Mark the requested length with mounted measuring rod.
2. Cable: Loosen the three pins on the gravity weight
   - Cable ø 4: hexagon 3
   - Cable ø 6, cable ø 8: hexagon 4
3. Cable: remove the pins
4. Cable: Pull the cable out of the gravity weight
5. Shorten the cable/rod with a cut-off wheel or metal saw at the marking. Take note of the specifications in the following illustration when shortening the cable.
6. Cable: shift the cable into the gravity weight (according to the drawing)
   - Plastic coated cable: remove coating according drawing to 70 mm (2.76 in).
7. Cable: Fasten the cable with three pins, torque 20 Nm (14.75 lbf in)
   
   Cable ø 4: 7 Nm (5.16 lbf ft)
   
   Cable ø 6, cable ø 8: 20 Nm (14.75 lbf ft)

8. Enter new probe length and then carry out a fresh adjustment see "Setup procedure, Carrying out min. adjustment - Carrying out max. adjustment"

Fig. 43: Shortening the cable probe
A  Gravity weight - cable ø 4 mm
B  Gravity weight - cable ø 6 mm
1  Threaded pins
2  Thread M12 for eye-bolt
3  Threaded pins
10 Removal

10.1 Removal steps

⚠️ Warning:
Before dismounting, be aware of dangerous process conditions such as e.g. pressure in the vessel or pipeline, high temperatures, corrosive or toxic products etc.

Take note of chapters "Mounting" and "Connecting to power supply" and carry out the listed steps in reverse order.

10.2 Disposal
The instrument consists of materials which can be recycled by specialised recycling companies. We use recyclable materials and have designed the parts to be easily separable.

Correct disposal avoids negative effects on humans and the environment and ensures recycling of useful raw materials.

Materials: see chapter "Technical data"

If you have no way to dispose of the old instrument properly, please contact us concerning return and disposal.

**WEEE directive 2002/96/EG**
This instrument is not subject to the WEEE directive 2002/96/EG and the respective national laws. Pass the instrument directly on to a specialized recycling company and do not use the municipal collecting points. These may be used only for privately used products according to the WEEE directive.

- Cable: ø 6 mm (0.236 in) approx. 80 g/m (0.86 oz/ft)
- Cable: ø 11 mm (0.433 in) - PA coated approx. 320 g/m (3.44 oz/ft)
- Gravity weight for cable ø 4 mm (0.157 in) and cable: ø 6 mm (0.236 in) - PA coated 325 g (11.46 oz)
- Gravity weight for cable ø 6 mm (0.236 in) and cable: ø 11 mm (0.433 in) - PA coated 780 g (27.51 oz)

Probe length L (from seal surface)
- Rod: ø 16 mm (0.63 in) up to 6 m (19.69 ft)
- Trimming accuracy - rod ±(1 mm + 0.05 % of the rod length)
- Cable: ø 4 mm (0.157 in) up to 75 m (246.1 ft)
- Cable: ø 6 mm (0.236 in) - PA coated up to 65 m (213.3 ft)
- Cable: ø 6 mm (0.236 in) up to 75 m (246.1 ft)
- Cable: ø 11 mm (0.433 in) - PA coated up to 65 m (213.3 ft)
- Trimming accuracy - cable ±(2 mm + 0.05 % of the cable length)

Lateral load with rod: ø 16 mm (0.63 in) 30 Nm (22.13 lbf ft)

Max. tensile load
- Cable: ø 4 mm (0.157 in) 12 KN (2698 lbf)
- Cable: ø 6 mm (0.236 in) - PA coated 8 KN (1798 lbf)
- Cable: ø 6 mm (0.236 in) 30 KN (6744 lbf)
- Cable: ø 11 mm (0.433 in) - PA coated 30 KN (6744 lbf)

The tensile force of solids are subject of a normal fluctuation range. For this reason, the determined diagram value of the following diagrams must be multiplied with safety factor 2.
Fig. 44: Max. tensile load with cereals and plastic granules - Cable: ø 4 mm (0.157 in)
A  Cereals
B  Plastic granules
1  Tensile force in kN (the determined value must be multiplied with safety factor 2)
2  Cable length in m
3  Vessel diameter 12 m (39.37 ft)
4  Vessel diameter 9 m (29.53 ft)
5  Vessel diameter 6 m (19.69 ft)
6  Vessel diameter 3 m (9.843 ft)

Fig. 45: Max. tensile load with sand and cement - Cable: ø 4 mm (0.157 in)

< 1 mm (0.039 in)

**Accuracy (according to DIN EN 60770-1)**

Process reference conditions according to DIN EN 61298-1
- Temperature \(+18 \ldots +30 \, ^{\circ}\text{C} (+64 \ldots +86 \, ^{\circ}\text{F})\)
- Relative humidity 45 \(\ldots\) 75 %
- Air pressure \(+860 \ldots +1060 \, \text{mbar}+/86 \ldots +106 \, \text{kPa}\)
\(+12.5 \ldots +15.4 \, \text{psig}\)

Installation reference conditions
- Temperature \(+18 \ldots +30 \, ^{\circ}\text{C} (+64 \ldots +86 \, ^{\circ}\text{F})\)
- Relative humidity 45 \(\ldots\) 75 %
- Air pressure \(+860 \ldots +1060 \, \text{mbar}+/86 \ldots +106 \, \text{kPa}\)
\(+12.5 \ldots +15.4 \, \text{psig}\)

Installation reference conditions
- Min. distance to internal installations > 500 mm (19.69 in)
- Vessel metallic, \(\varnothing 1 \, \text{m (3.281 ft)}, \) centric installation, process fitting flush with the vessel ceiling
- Reflector metallic, \(\varnothing 1 \, \text{m}\)
- Medium Bulk solids - cereals, flour, cement (dielectric constant \(-2.0\))
- Installation Probe end does not touch the vessel bottom

Sensor parameter adjustment No gating out of false signals carried out

\(^4\) The indication values can be assigned individually
Fig. 48: Measuring ranges - GWR-2000
1 Reference plane
2 Probe length L
3 Measuring range
4 Upper dead band (see following diagrams - grey section)
5 Lower dead band (see following diagrams - grey section)

Typical deviation

See following diagrams

Fig. 49: Deviation GWR-2000 in rod version
1 Dead band - no measurement possible in this area
L Probe length

5 Depending on the installation conditions, deviations can occur which can be rectified by adapting the adjustment or changing the measured value offset in the DTM service mode
Variables influencing measurement accuracy

Specifications for the digital measured value

Temperature drift - Digital output
±3 mm/10 K relating to the max. measuring range or max. 10 mm (0.394 in)

Additional deviation through electromagnetic interference acc. to EN 61326
< ±10 mm (< ±0.394 in)

Specifications apply also to the current output

Temperature drift - Current output
±0.03%/10 K relating to the 16 mA span max. ±0.3%

Deviation on the current output through analogue/digital conversion
- Non-Ex and Ex-ia version
< ±15 µA
- Ex-d-ia version
< ±40 µA

Additional deviation through electromagnetic interference acc. to EN 61326
< ±150 µA

Influence of the superimposed gas and pressure to the accuracy

The propagation speed of the radar impulses in gas or vapour above the medium is reduced by high pressure. This effect depends on the superimposed gas or vapours.

The following table shows the resulting deviation for some typical gases and vapours. The specified values refer to the distance. Positive values mean that the measured distance is too large, negative values that the measured distance is too small.

### Characteristics and performance data

- Measuring cycle time: < 500 ms
- Step response time: ≤ 3 s
- Max. filling/emptying speed: 1 m/min

**Products with high dielectric constant (>10) up to 5 m/ min.**

### Ambient conditions

Ambient, storage and transport temperature: -40 … +80 °C (-40 … +176 °F)

### Process conditions

For the process conditions, please also note the specifications on the type label. The lowest value always applies.

The measurement error through the process conditions in the specified pressure and temperature range is < 1 %.

**Process pressure:** -1 … +40 bar/-100 … +4000 kPa (-14.5 … +580 psig), depending on the process fitting.

**Vessel pressure relating to the flange nominal pressure stage:** see supplementary instructions manual "Flanges according to DIN-EN-ASME-JIS"

**Process temperature - Cable versions with PA coating:** -40 … +80 °C (-40 … +176 °F)

**Process temperature (thread or flange temperature) with process seals:**
- FKM (SHS FPM 70C3 GLT): -40 … +150 °C (-40 … +302 °F)
- EPDM (A+P 75.5/KW75F): -40 … +150 °C (-40 … +302 °F)
- FFKM (Kalrez 6375) - with temperature adapter: -20 … +200 °C (-4 … +392 °F)

---

7) Time span after a sudden measuring distance change by max. 0.5 m in liquid applications, max 2 m with bulk solids applications, until the output signal has taken for the first time 90 % of the final value (IEC 61298-2).

**Voltage supply**

Operating voltage \( U_B \)
- Non-Ex instrument, Ex-d instrument: 9.6 ... 35 V DC
- Ex ia instrument: 9.6 ... 30 V DC
- Ex-d-ia instrument: 15 ... 35 V DC
- Ex-d-ia instrument with ship approval: 15 ... 35 V DC

Operating voltage \( U_B \) - illuminated display and adjustment module
- Non-Ex instrument, Ex-d instrument: 16 ... 35 V DC
- Ex ia instrument: 16 ... 30 V DC
- Ex-d-ia instrument: No lighting (integrated ia barrier)

Reverse voltage protection: Integrated

Permissible residual ripple - Non-Ex, Ex-ia instrument
- for \( 9.6 \text{ V} < U_B < 14 \text{ V} \): \( \leq 0.7 \text{ V}_{eff} \) (16 ... 400 Hz)
- for \( 18 \text{ V} < U_B < 36 \text{ V} \): \( \leq 1.0 \text{ V}_{eff} \) (16 ... 400 Hz)

Permissible residual ripple - Ex-d-ia instrument
- for \( 18 \text{ V} < U_B < 36 \text{ V} \): \( \leq 1 \text{ V}_{eff} \) (16 ... 400 Hz)

Load resistor
- Calculation: \( (U_B - U_{min})/0.022 \text{ A} \)
- Example - Non-Ex instrument with \( U_B = 24 \text{ V} \text{ DC} \): \( (24 \text{ V} - 9.6 \text{ V})/0.022 \text{ A} = 655 \text{ Ω} \)
